## SIT - Chain Drives

SIT S.p.A. can provide a wide and complete range of sprockets and plate sprockets up to a 2-inch pitch according to the British Standard, with plain or finished bore and keyway. American Standard sprockets are available upon request.

The materials used in sprockets are high-quality carbon steels (in forged steel or with welded hub).

When conditions call for heavy duty use, we can provide hardened teeth sprockets. In corrosive operating conditions, stainless steel is recommended.

Special and custom sprockets according to customer's drawings are available on upon request.

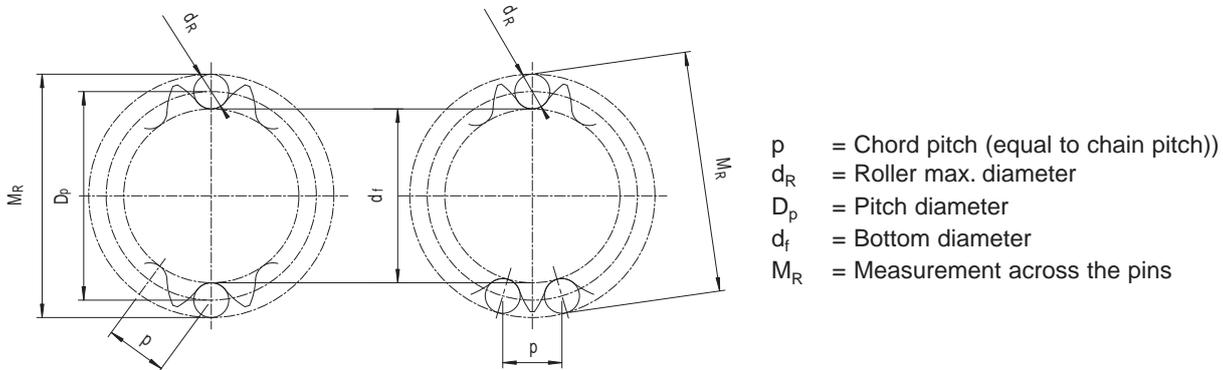

For specific projects, SIT S.p.A. manufactures customized products such as:

- Stainless steel sprockets
- Sprockets with "keyless" shaft-to-hub locking device system
- Compound sprockets with 2 or more pitches and/or different number of teeth
- Split sprockets, made in two parts
- Taper bushing sprockets
- Cast iron plate wheels

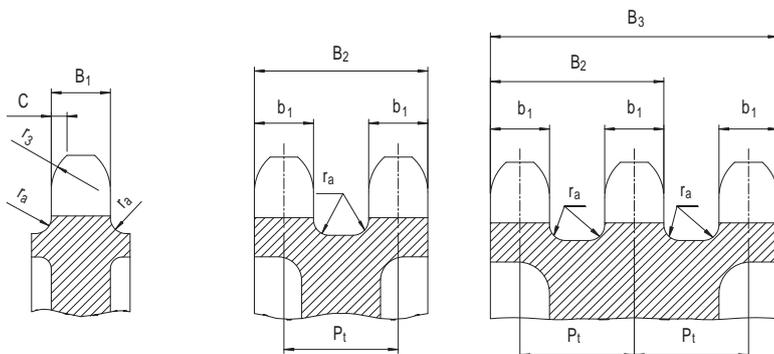

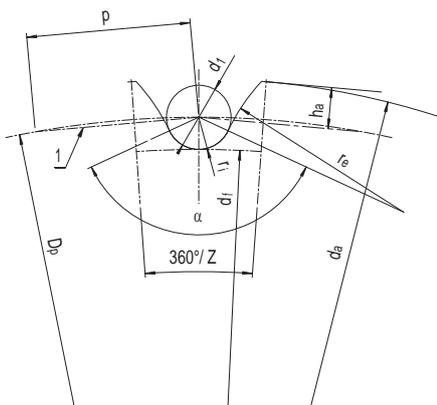

## Reference Standards and metric sizes (ISO/R 606)

Sprocket nomenclature is represented by the following diagrams:

$$M_R = D_p + d_{R,min} \rightarrow \text{sprockets with even number of teeth}$$

$$M_R = D_p \cos\left(\frac{90^\circ}{Z}\right) + d_{R,min} \rightarrow \text{sprockets with odd number of teeth}$$

### Pitch diameter

The sprocket pitch diameter  $D_p$  is the diameter of a circle drawn through centers of the rollers of a chain wrapped around the sprocket:

$$D_p = p \cdot \frac{1}{\sin\left(\frac{180^\circ}{Z}\right)}$$

Where:

$p$  = chain pitch

$Z$  = number of teeth

By knowing the chain pitch and the number of teeth, the following table allows for a rapid calculation of the sprocket diameter.

Number of Tooth $Z$	$\frac{1}{\sin\left(\frac{180^\circ}{Z}\right)}$						
6	2,000	23	7,344	40	12,745	57	18,153
7	2,305	24	7,661	41	13,063	58	18,471
8	2,613	25	7,979	42	13,381	59	18,789
9	2,924	26	8,296	43	13,7	60	19,107
10	3,236	27	8,614	44	14,018	61	19,425
11	3,549	28	8,931	45	14,336	62	19,744
12	3,864	29	9,249	46	14,654	63	20,062
13	4,179	30	9,567	47	14,972	64	20,38
14	4,494	31	9,885	48	15,29	65	20,698
15	4,81	32	10,202	49	15,608	66	21,016
16	5,126	33	10,52	50	15,926	67	21,335
17	5,442	34	10,838	51	16,244	68	21,653
18	5,759	35	11,156	52	16,562	69	21,971
19	6,076	36	11,474	53	16,88	70	22,289
20	6,392	37	11,792	54	17,198	71	22,607
21	6,71	38	12,11	55	17,517	72	22,926
22	7,027	39	12,428	56	17,835	-	-

### Outer diameter

The outer diameter is the diameter of the circle circumscribing the sprocket teeth. If the sprocket has an even number of teeth, this corresponds to the diameter which is measured from a tooth head to the diametrically opposite tooth head.

$$D_e = D_p + (0,6 \div 0,8) \cdot d_1$$

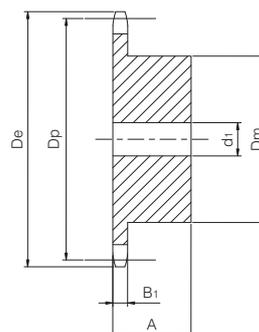

### Tooth bottom diameter $d_f$

This is obtained by calculating the ratio:

$$d_f = D_p - d_1$$

with tolerances according to following table:

Tooth bottom diameter $d_f$ [mm]	Tolerance [mm]
$d_f \leq 127$	0 - 0,25
$127 < d_f \leq 250$	0 - 0,30
$d_f > 250$	h11

### Thickness sprocket

$$B_1 = (0,9 \div 0,93) \cdot \text{Internal width chain}$$

## How to select a transmission chain

The first step in sizing the correct chain is to collect the design data:

- type of motor
- type of driven equipment
- rated torque
- drive shaft rotation speed and diameter
- driven shaft rotation speed and diameter
- distance between shaft centers
- tolerance of distance between shaft centers
- sprocket max. overall dimensions
- lubrication systems available, if any
- environmental conditions in which the chain drive will operate
- type of duty (continuous, intermittent, jolting during start or sharp stops)

### Service factor calculation

The following parameters should be also known to better determine the drive service factor:

- starts/stops frequency
- required starting torque
- operating temperature
- large load variations during working cycles, if any
- driven shaft size available, if any

Service factor $F_s$	Load characteristics	Combustion engines with hydraulic clutch	Electric motors or turbines	Combustion engines with friction clutch
	UNIFORM	1,0	1,0	1,2
	PULSATING	1,3	1,3	1,4
	TRIPPING	1,4	1,5	1,7

### Design power calculation

$$P_p = P_n \cdot F_s$$

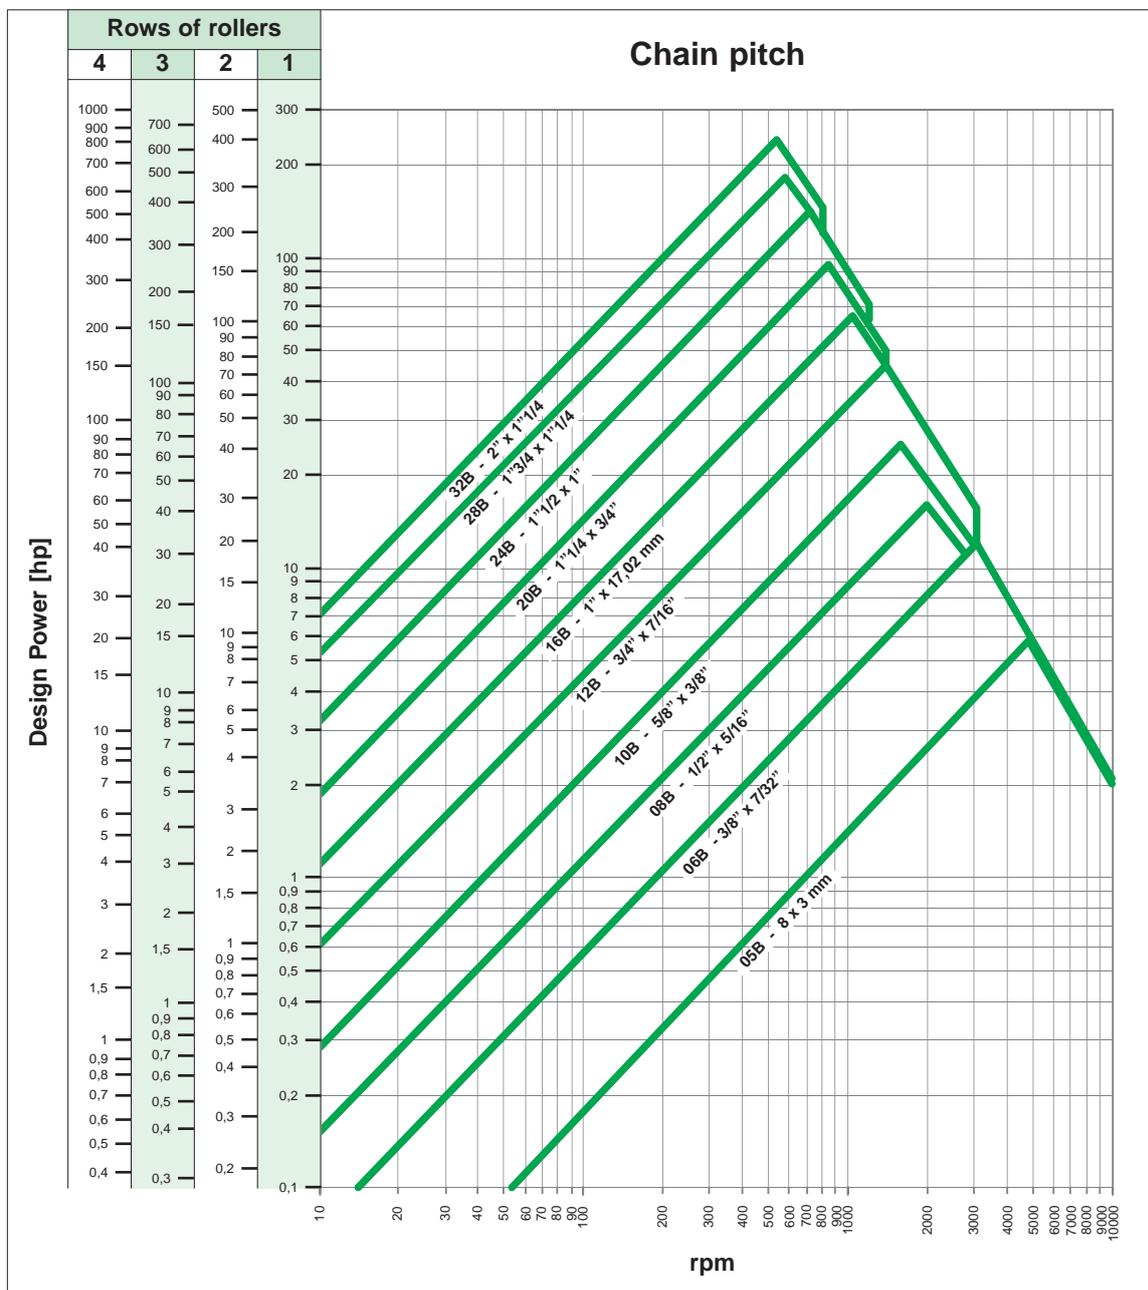

$P_p$  = design power

$P_n$  = engine rated power

$F_s$  = service factor

### How to choose a chain

Use following alignment chart to choose the correct chain size according to the design power and the shaft rotation speed. Double check by calculating the stresses during operation.

### Calculation of minimum sprocket pitch diameter

$$D_p = p + 2d_a \quad [\text{mm}]$$

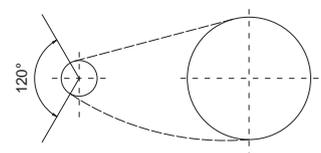

p = chain pitch

da = shaft diameter

If you know the pitch diameter, you also know the number of teeth Z.

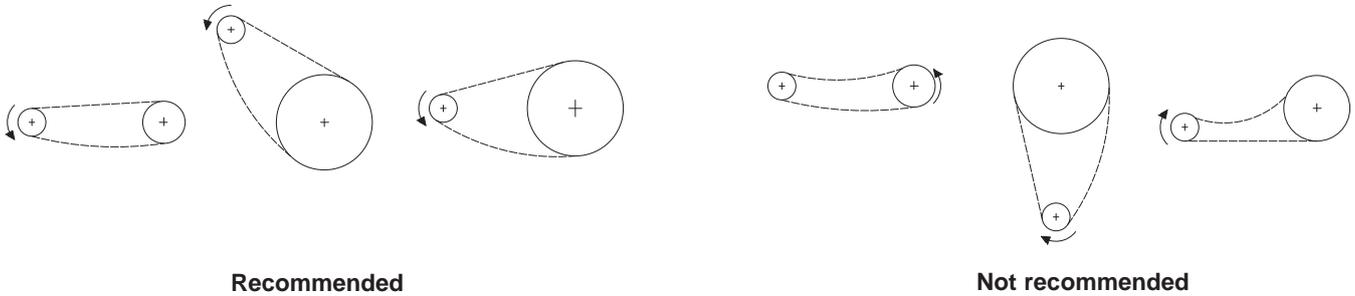

Except for low-speed drives, it is not advisable to have sprockets with less than 17 teeth because this would increase polygonal effects and consequently also increase vibration on the chain with stresses between joints and impacts on the teeth.

It is also recommended to have chain wrap greater than 120° to avoid the risk of non-mesh engagement on the sprocket.

### Shaft position

The shaft should be positioned between the horizontal axis and 60° because the vertical position increases the possibility of chain release from the sprocket. If necessary, use a chain tensioning system.

### Transmission ratio

$$RT = \frac{n_2}{n_1} \approx \frac{d}{D} \approx \frac{Z_1}{Z_2}$$

- $n_1$  = number of revolutions, high speed shaft
- $n_2$  = number of revolutions, low speed shaft
- $d$  = high speed shaft diameter
- $D$  = low speed shaft diameter
- $Z_1$  = number of teeth of high speed sprocket
- $Z_2$  = number of teeth of low speed sprocket

As a rule, the maximum allowable transmission ratio is 8.

If this value is exceeded, please adjust the application variables until the required value is reached. Contact our technical support department if you have questions.

### Calculation of driven sprocket pitch diameter

$$Z_2 = Z_1 \cdot RT$$

By knowing the number of teeth, calculate the pitch diameter using the trigonometric table on page 3.

### Chain length calculation

$$\text{If } RT = 1 \rightarrow L = \frac{2C}{p} + Z \quad [\text{No. of pitches}]$$

$$\text{If } RT \neq 1 \rightarrow L = \frac{2C}{p} + \frac{Z_1 + Z_2}{2} + 0,1013 \frac{(Z_2 - Z_1)^2}{\frac{4C}{p}} \quad [\text{No. of pitches}]$$

$C$  = distance between centers [mm]

$p$  = chain pitch [mm]

### Calculation of chain linear speed

$$V = \frac{\pi \cdot D_p \cdot n}{60} \quad [\text{m/s}]$$

As a rule, if  $V > 5$  m/s the centrifugal force influence acting on the drive becomes important.

**Calculation of forces acting on the drive**Chain pull

$$T = \frac{75 \cdot P_p}{V} g \quad [\text{N}]$$

$P_p$  = design power [hp]

$V$  = chain linear speed [m/s]

$g$  = acceleration due to gravity (= 9.81 m/s<sup>2</sup>)

Centrifugal force

$$F_C = W \cdot V^2 \quad [\text{N}]$$

$W$  = chain weight [kg/m]

Resultant force

$$F_{\text{TOT}} = T + F_C \quad [\text{N}]$$

**Calculation of safety factor**

$$k = \frac{R_T}{F_{\text{TOT}}}$$

$R_T$  = chain ultimate strength

$F_{\text{TOT}}$  = resultant force

As a rule, the safety factor must be greater than 8.

Values greater than 5 can be accepted if using high quality chains.

**Multiple chains**

If the chain cannot transmit all the required power, a multiple strand chain can be chosen by using following table as a reference, which considers the connection of 2 or more chains:

Rows of rollers	Multiple service factor $F_m$
2	1,7
3	2,5
4	3,3
5 and more	Contact SIT support technical department

**Power design with multiple chains**

$$P_p = \frac{P_n \cdot F_s}{F_m}$$

$P_n$  = nominal engine power

$F_s$  = service factor

$F_m$  = multiple service factor

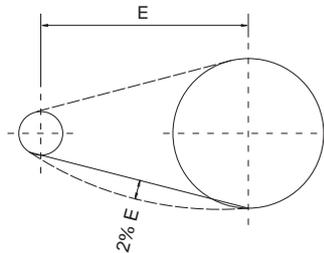

Important notice: the ultimate strength, i.e. the static load which breaks the chain, is not the only parameter which defines the quality, because it is just a minimum value stated by the ISO and ANSI Standards.

The working load is more specific, because there are low quality chains with very high ultimate strengths but very low maximum allowable working loads.

Generally, consider following this practical rule: the working load must be smaller than 1/6 of the ultimate strength and 50% of that value should not be exceeded, not even for one cycle, because this may permanently damage the chain components.

## Installation of a transmission chain

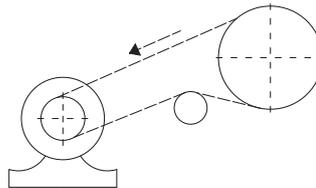

To optimize the sprocket life, the distance between the sprocket axes should be equal to a length between 30 and 50 times the chain pitch and, generally, the camber should not exceed 2% of the distance between centers. When assembling, consider the manufacturing tolerance on the chain (generally equal to +0,15%) and make sure that the smaller sprocket has at least 17 teeth and that at least three of them are in mesh.

If the chain drive is vertical, we suggest that the motor sprocket position be higher than that of the driven sprocket to keep the chain in tension.

If you want to place the motor sprocket in a lower position than the driven sprocket, we recommend that you use a chain tensioning system, because the chain must always be properly tensioned.

Generally, the tensioning system should be at a distance of at least six pitches from the sprocket and it must press toward the drive inner side, in order to reduce the overall dimensions and to increase the wrap angle.

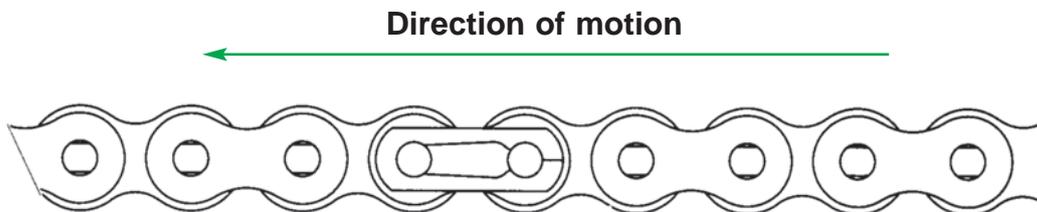

Consequences of wrong tensioning could be:

- Additional fatigue on components
- Faster wear
- Noisy running
- Lower performance
- Bearings overloaded

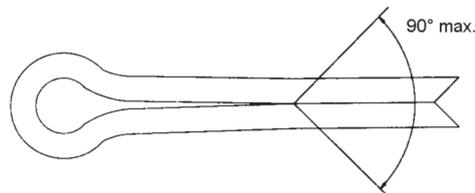

## Chain assembly

To assemble a chain, wrap it around the teeth of the sprockets and connect both ends on one of the two sprockets. There are two types of connecting links:

- spring clip links: these connecting links are used with chains up to 1" pitch. The closed part of the spring clip must face the direction of motion.

- split pin links: put the split pin into the pin hole and open it to create an angle not greater than 90°. Do not reuse split pins after they have been removed.

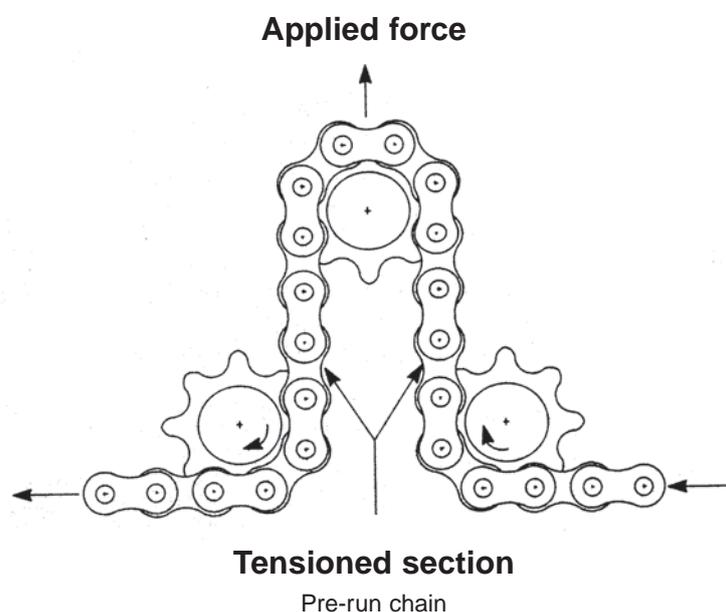

### Pre-tensioning and pre-running

These two operations remove surface imperfections which are present between the bushings and pins in a new chain, thus removing imperfections and reducing the lengthening of the chain which occurs during the initial startup.

Pre-tensioning: this allows the chain to be tightened to near its yield point.

Pre-running: the chain passes through a number of rotation cycles in order to reach a tension near its yield strength.

## Chain lubrication

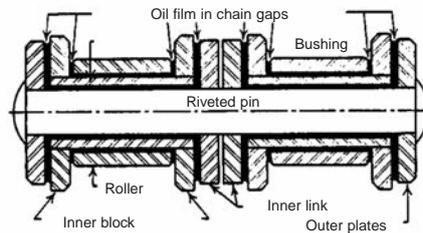

Lubrication is a fundamental procedure to ensure the normal life of a chain.

The key points for a proper and effective lubrication are the type of lubricant and the frequency of application. Theoretically, there should always be a layer of lubricant between the different chain surfaces.

In particular, lubrication acts:

- to reduce the coefficient of friction
- to prevent chain wear and to increase operation life
- to prevent corrosion
- to dissipate heat generated during operation
- to lubricate the contact surfaces between chain and sprocket

Ideally, for effective lubrication, the lubricant must go between pins, bushings, rollers and plates on the links, as shown in the picture below.

### Choice of lubricant

For proper lubrication it is essential that components are always clean and free of impurities that may form during normal chain operation and which otherwise may build up between the lubrication layer and the contact surfaces, thus increasing the coefficient of friction.

The lubricant to be used should have specific viscosity characteristics according to the operating temperature.

Temperature interval [°C]	Recommended lubricant
[-6 ; +5]	SAE 20
[+5 ; +38]	SAE 30
[+38 ; +49]	SAE 40
[+49 ; +60]	SAE 50

When the operating temperatures are higher than 300°C we recommend using a synthetic lubricant with solids in suspension which ensures a dry lubrication after the liquid contents have evaporated.

Since a large amount of smoke can be developed during this process, lubrication should be done at the lowest chain temperature area.

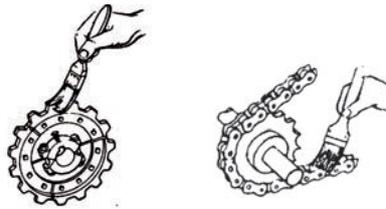

## Lubrication methods

Various lubrication methods can be used for chain drives.

### • Manual lubrication

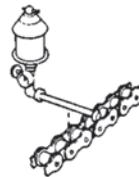

The oil must go between the outer and the inner plate and between the bushing and the roller to reduce friction between the contact areas. Manual lubrication should be employed in very clean environments, because otherwise the dirt buildup compromises its effectiveness. In these cases we recommend abundant daily lubrication.

Manual lubrication is recommended with speeds less than 1 m/s and the oil should be applied with oiler or brush.

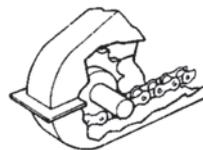

### • Drip-feed lubrication

This is a continuous lubrication applied with a special device suitable for this kind of application. It is recommended with speeds up to 2,5 m/s.

### • Oil bath lubrication

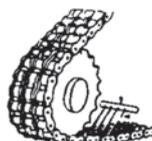

The lowest chain section runs in an oil bath and the minimum oil level should reach the center line of the chain link. It is recommended with speeds up to 8 m/s.

### • Forced lubrication system

Forced lubrication system consists of an oil pump where the oil is forced under pressure through the lubricators placed over the chain for a very effective lubrication.

To achieve maximum lubrication result, lubricators should be placed near the mesh point of the lowest wheel. This is a very effective lubrication system for operating speeds higher than 8 m/s.

## Problems and solutions

The table below provides some information about the most common problems with transmission chains. Please note that the main problems (lubrication, noise, re-tensioning) can be easily solved by replacing chains with timing belts which do not require maintenance.

Problem	Possible cause	Solution
Wear on one chain and/or sprocket side	1. Shafts are not parallel, sprockets are not aligned	1. Proper shaft alignment
Wear on a tooth head	1. Anomalous chain elongation 2. Toothing error	1. Replace chain 2. Replace sprockets
Wear on sprocket sides	1. Material with low yield strength	1. Change sprockets with new ones made of suitable material or with hardened teeth
Chain vibration	1. Sprocket eccentricity 2. Chain roller braking	1. Replace sprocket and check hole eccentricity 2. Replace worn components
Premature elongation	1. Insufficient lubrication or chain is undersized	1. Check proper selection and /or improve lubrication
Rust spots on the chain	1. Insufficient lubrication	1. Improve lubrication
Tooth jumping	1. Insufficient chain tension 2. Chain wear	1. Re-tension the chain, install a chain tensioning device 2. Replace the chain
Chain parts are broken	1. Overloaded transmission 2. Corrosion 3. Chain speed is too high 4. Contact with foreign objects during operation 5. Sprockets with wrong toothing 6. Insufficient lubrication 7. Insufficient chain tension	1. Check the selection of the chain 2. Avoid corrosive environments, use stainless steel components 3. Check the selection of the chain 4. Remove foreign objects and check for proper chain protection 5. Replace sprockets 6. Improve lubrication. 7. Check the chain tension
Excessive noise	1. Foreign objects in the transmission chain 2. Insufficient lubrication 3. Worn or missing rollers 4. High misalignment 5. Tooth jumping	1. Make sure that no foreign objects interfere with the transmission chain 2. Improve lubrication 3. Replace worn components 4. Align shaft and sprockets 5. Re-tension the transmission chain

Sprockets for simplex, duplex and triplex chain

The background of the page is a teal color. It features several metallic sprockets of various sizes. One large sprocket is in the upper right, and several smaller ones are scattered below it. The sprockets have a brushed metal finish and a central hole. The word 'Sprockets' is written vertically in a large, bold, green font across the bottom right portion of the image.

Simplex sprockets with induction hardened teeth

The background of the entire page is a collage of various sprockets. Some are shown in close-up, highlighting the sharp, metallic teeth. Others are shown in a more distant, slightly blurred perspective. The sprockets are arranged in a way that creates a sense of depth and movement. The color palette is primarily light blue and white, with the sprockets themselves being a metallic silver or grey. The overall aesthetic is clean and industrial.

**SPROCKETS WITH FINISHED BORE**

Plate Wheels for Simplex, Duplex and Triplex Chain

The background of the lower half of the page is a close-up photograph of several metallic plate wheels. The wheels are arranged in a way that they overlap, creating a sense of depth. The lighting is bright, highlighting the metallic texture and the sharp edges of the teeth. The overall color palette is dominated by shades of teal and light blue.

Idler sprockets with ball bearing

A close-up photograph of a grey metal idler sprocket with several teeth is positioned vertically in the center of the page. The sprocket is set against a light blue background that has a subtle gradient. The sprocket's teeth are sharp and pointed, and the overall image is oriented vertically.

## Chain components

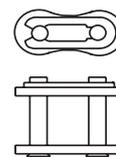

The roller chain is fabricated according to ISO/DIN/BS Standards and it consists of five components:

### Connecting link with spring clip

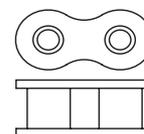

Available from 05B to 16B.

The standard closing plate has been designed for sliding assembly on pins. Positioning is provided by a flat steel spring clip with a split end to allow the installation in the pin side slots.

### Inner links

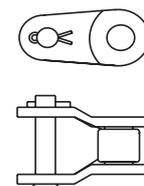

Standard links for all roller chain sizes. They are supplied fully assembled. The two bushings are pressed into the single joint plates. The inner links are used for single or multiple chains.

### Offset link with one roller

Available for single, double and triple strand chains.

The flat milled surface on one pin end prevents plate rotation

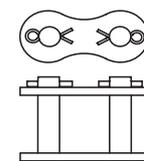

### Connecting links with split pin

Available from 20B to 32B.

The closing plate can be pressed or made to slide on the pins.

Pressure joints are recommended for heavy duty. Pressure closing plates are standard in multiple chains used in the oil industry.

### Chain packages

Length in meters (Standard):

- Box, 5 m
- Rollers, 25, 50 or 100 m

Cut sizes (upon request):

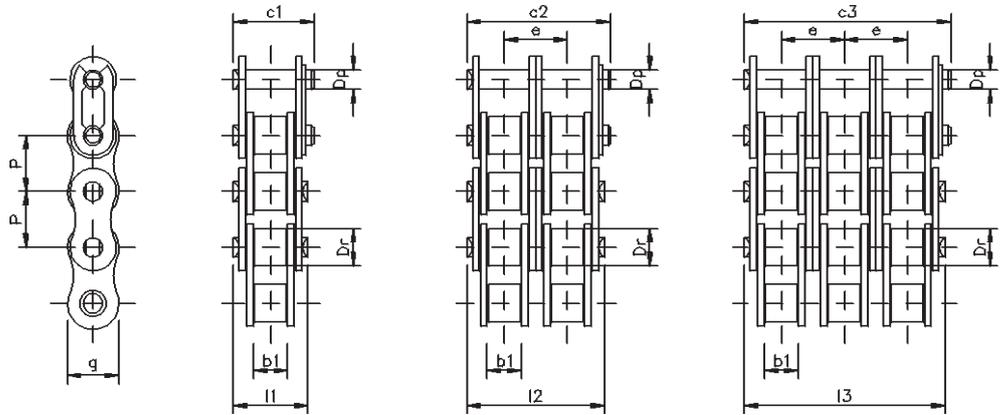

- Open
- Ready to be closed by connecting links
- Closed by connecting links
- Closed by rivets

# TRANSMISSION ROLLER CHAIN

## Transmission roller chain – British Standard DIN 8187 ISO/R 606

Available models:

- With flat profile plates ("C"-Type)
- Nickel-plated, Zinc-plated
- Stainless steel AISI 304

# Transmission roller chains - American Standard

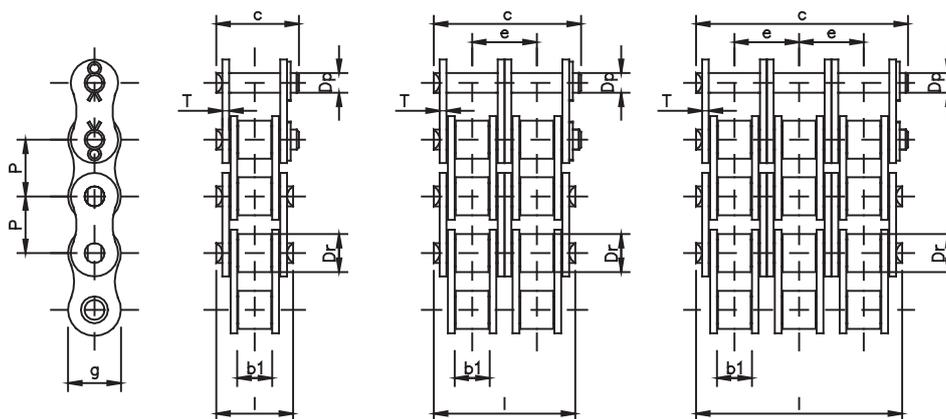

ISO R/606 – DIN 8188 - ANSI B29.1

The chains from series ANSI 25 to ANSI 50 are only available in riveted model; from series ANSI 60 onwards they are available also with split pin, upon request.

Available models:

- With flat profile plates ("C"-Type)
- Nickel-plated, Zinc-plated
- Stainless steel AISI 304

All transmission roller chains, both British and American Standards, can be supplied, upon request, with vertical attachments, square attachments, with one or two holes and with projecting pins.

# TRANSPORT CHAINS

## Types of transport chains

Chains with sliding plates

Roller Chains

Advantages:

- Easier to manufacture
- Cheaper solution with same load strength
- More effective in dirty environments

Disadvantages:

- Movement requires more power

Advantages (due to lower friction):

- Larger distances between centers
- Lower power is required
- Less operating costs

Disadvantages:

- Not suitable in dirty environments because rollers may become blocked

## Types of attachments

Transport chains can be equipped with special attachments, such as links with plates, pushers, protruding pins to support or to drag the material.

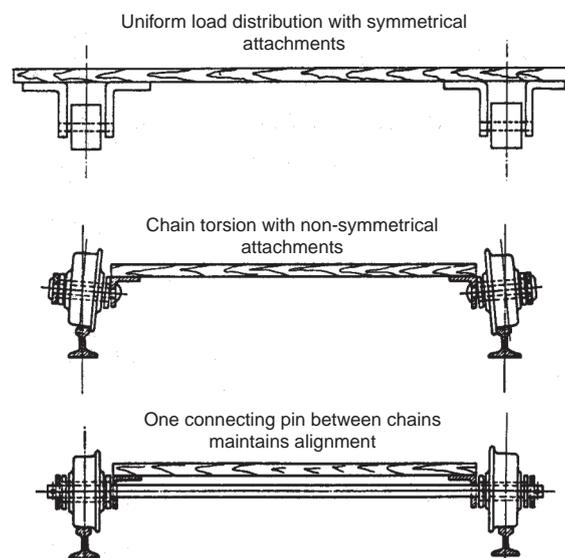

Two types available:

Symmetrical attachments ( K o M):

- Uniformly distributed load on the chain
- Good alignment
- Suitable for very heavy loads or for non-symmetrical load distribution

Non-symmetrical attachments ( A o M35):

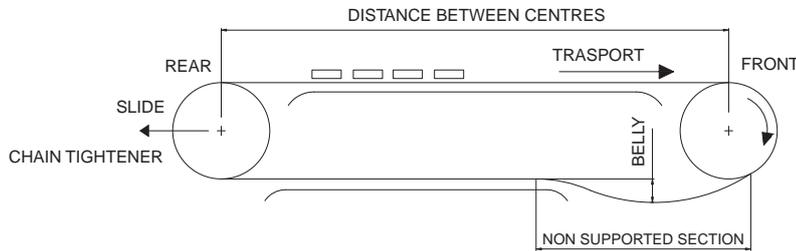

- Non-symmetrical load distribution with possible chain torsion
- Irregular stress distribution and consequent wear of the chain bearing surface (rollers or plates)
- To be used with connecting pins between the two chains to help maintaining correct alignment (see different configurations of figure 2)
- To be used with reduced transporting weight and with short distances between centers of chains

# Conveyor chain installation

The best configuration for a chain conveyor is shown in the following diagram:

- Driving sprocket in the front part
- Well supported chain both in the operating and in the reverse section

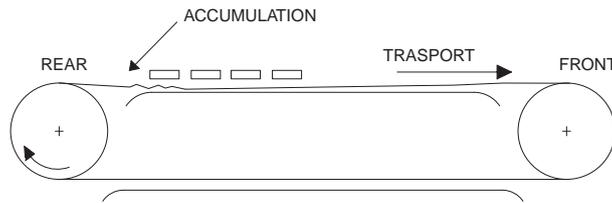

In the driving sprocket exit section there should be a non-supported section, which has two functions:

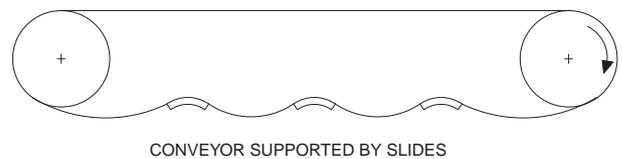

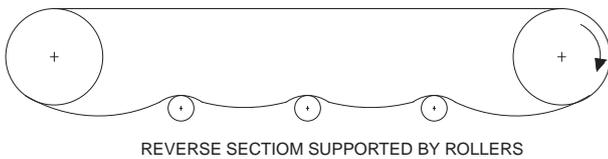

- it allows the chain to set
- the “belly” weight force keeps the chain in mesh with the driving sprocket

There is no wear between pin and bushing because of the very low tension in the reverse section and the deflection is reduced by the support guides.

It is not advisable to install the driving sprocket in the rear of the conveyor because the chain, which is always under load during the whole distance covered, would suffer abnormal wear. Especially in the area of high pressure, i.e. where the material is loaded, there is a risk of chain accumulation in the driving sprocket area and the chain may consequently fall off.

Use a chain tightening device to adjust the distance between centers and to maintain a correct “belly” but do not overload the chain. Other installation methods are shown in following figure. These types of supports cause more wear because the chain is supported only in short sections.

## Problems and solutions

The most common problem of conveyors is tripping. Following table shows some possible causes and solutions of this problem.

Possible cause	Solution
Excessive friction	Clean and lubricate moving parts
Conveyor is too long	Use shorter conveyor sections
Conveyor speed is too low	Increase the speed or the number of teeth of the driving wheel
Speed variations due to polygonal effect	Use driving plate wheels with 12 or more teeth

# How to find the right conveyor chain size

## 1 – Conveyor classification

Conveyors are identified in 6 classes according to the type of chain and the type of movement of the transported material

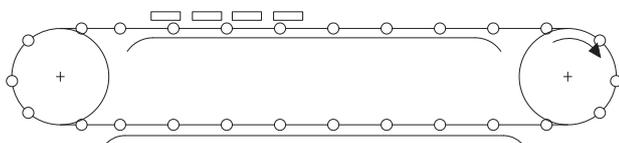

Class	Chain Material	Material
A	Sliding chain	Transported
B	Roller chain	Transported
C	Chain with additional rollers	Transported
D	Sliding chain with fins	Sliding
E	Sliding chain without fins	Sliding
F	Roller chain	Sliding

## 2 - Total load on the chain

The calculation of the total load acting on the chain depends on the conveyor classification.

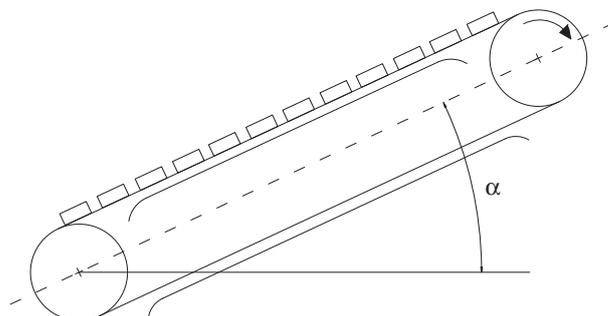

### - Transported load with sliding chain or with roller chain (classes A,B,C)

Horizontal conveyor

$$T = g \cdot f_1 \cdot C(2P + P_1) + J \quad [N]$$

Inclined conveyor

$$T = g \cdot C [P(2f_1 \cos \alpha + \sin \alpha) + P_1(f_1 \cos \alpha + \sin \alpha)] + J \cos \alpha \quad [N]$$

- T = Total chain load [N]
- g = Acceleration due to gravity = 9.81 m/s<sup>2</sup>
- f<sub>1</sub> = Coefficient of friction between chain and guide
- C = Distance between centers of conveyor [m]
- P = Chain weight per meter [kg/m]
- P<sub>1</sub> = Weight per meter of the transported material acting on the chains and of their supports (shutters, crosspieces, hinges) [kg/m]
- J = Load component given by the transported material [N]
- a = Transmission inclination

### Calculation of P coefficient

P = Chain linear weight. According to the different types, it can be calculated with the following formulas:

$$P = \frac{\text{Material total weight}}{600} \quad [kg/m] \quad \text{for transported load and roller chains}$$

$$P = \frac{\text{Material total weight}}{200} \quad [kg/m] \quad \text{for load and/or sliding chains}$$

Calculation of coefficient  $f_1$

$f_1$  = the coefficient of friction between chain and guide varies according to the type of chain (sliding or roller chain).

Type of chain	$f_1$
Non-lubricated steel guide	0,3 ÷ 0,5
Lubricated steel guide	0,2
Wood	0,5
Polyethylene	0,15 ÷ 0,4

For roller chains the coefficient of friction is calculated according to the following formula, considering that, as a first approximation, you can take a value equal to 0,2 :

$$f_1 = f_r \frac{d_b}{d_r}$$

$f_r$  = 0,4 without lubrication

$f_r$  = 0,3 with lubrication

$d_b$  = chain bushing diameter or roller inner diameter [mm]

$d_r$  = roller outer diameter [mm]

Calculation of coefficient  $J$

$J$  = load component of the transported material

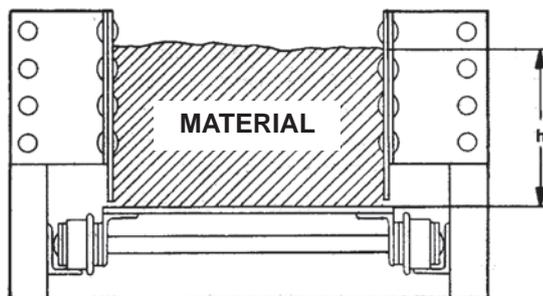

With solid materials use the known weight (in N).

With agglomerated materials, use the following formula:

$$J = C \frac{h^2}{f_H}$$

$h$  = height of the transported material [mm]

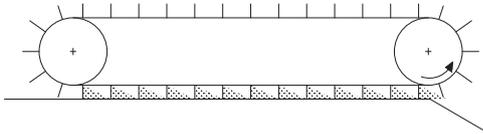

$f_H$  = characteristic value and table value of the material

Material	$f_2$	$f_H$
Aluminium	0,4	1200
Dry coal ash	0,5	1600
Humid coal ash	0,6	2400
Sugar	0,4	8900
Clinker cement	0,7	530
Pieces of anthracite coa	0,4	1100
Coke coal	0,55	1900
Wheat / Cereals	0,4	1000
Gravel	0,45	530
Lime	0,5	1200
Sand	0,6	300

- Sliding load with sliding or roller chain (class D, E, F)

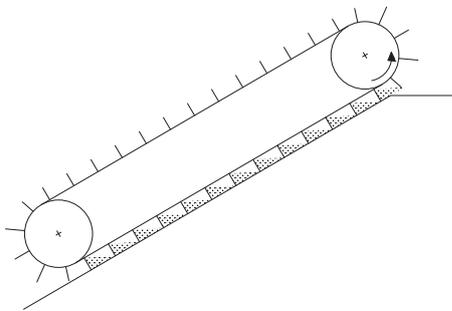

**Horizontal conveyor**

$$T = 9,81C \cdot (2f_1 P + f_2 P_1) + J$$

$f_2$  = coefficient of friction between material and runways (see table in previous page)

**Inclined conveyor**

$$T = g \cdot C [P(2f_1 \cos \alpha + \sin \alpha) + P_1(f_1 \cos \alpha + \sin \alpha)] + J \cos \alpha \quad [N]$$

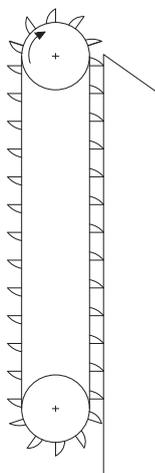

where:

$$P_1 = \frac{Q}{3,6v}$$

Q = conveyor hourly carrying capacity [t/h]

v = v chain translation speed [m/min]

- Elevator

$$T = 9,81C (P + P_1)$$

### 3 – Calculation of design working load

The calculation of the design working load takes into consideration the dynamics of the transported material.

In particular, with the service factor  $F_s$ , takes into consideration the load fluctuations, which may increase the static load on the chain.

On the contrary, with the speed factor  $F_v$ , takes into consideration the conveyor speed and the number of teeth on the sprocket.

Calculate according to following formulas:

$$T_p = T \cdot F_s \cdot F_T \cdot F_v \quad [\text{N}] \quad \text{for single chain conveyors}$$

$$T_p = T \cdot F_s \cdot F_T \cdot F_v \frac{1,2}{\text{n. chains}} \quad [\text{N}] \quad \text{for multiple chain conveyors}$$

With multiple chains, an additional safety factor should be considered for overloads due to non-homogeneous distribution of material, if any. This factor may drop to 1 with double chains and not heavy operating conditions.

Type of load	Operating conditions		Service Factor $F_s$	
	Start / stop under load	Overload %	8-10 working hours /day	10- 24 working hours /day
Uniform	than 5 per day	Less than 5%	1,0	1,2
Moderate peak load	5 to 2 per hour	5% to 20%	1,2	1,4
High peak load	2 to 10 per hour	20% to 40%	1,5	1,8

Temperature	Operating conditions		$F_T$
	Up to 100° C		1,0
	100° C to 180° C		1,1
	180° C to 260° C		1,2
	over 260°		Contact our technical support department

Speed factor $F_v$						
No. of teeth	Chain speed [m/min]					
	15	30	45	60	90	120
6	1,4	2,0	2,9	4,4	-	-
7	1,1	1,4	1,8	2,3	4,0	-
8	1,0	1,3	1,5	1,8	2,5	3,6
9	1,0	1,2	1,4	1,6	2,0	2,6
10	0,9	1,1	1,2	1,4	1,7	2,0
11	0,9	1,0	1,2	1,3	1,5	1,8
12	0,9	1,0	1,1	1,2	1,4	1,6
14	0,8	0,9	1,0	1,1	1,3	1,4
16	0,8	0,9	1,0	1,0	1,2	1,3
18	0,8	0,9	0,9	1,0	1,1	1,3
20	0,8	0,9	0,9	1,0	1,1	1,2
24	0,8	0,8	0,9	0,9	1,0	1,2

#### 4 – How to choose a chain

After having defined the design working load, choose the suitable chain by comparing the design load, multiplied by a safety factor, with its ultimate strength.

$$R_T = T_p \cdot k$$

$R_T$  = chain ultimate strength [N]  
 $k$  = safety factor

As a rule, consider a value equal to 8, because a stress of traction equal to 60% of the chain ultimate strength would result in permanent chain deformation. In case of heavier operating conditions, use higher values.

#### 5 – Check the size

The selected chain size can be verified by considering the exact chain weight.

In case of concentrated loads it is also necessary to check the specific pressure between rollers and bushings and between bushings and pins by using the following formulas:

$$\text{Specific pressure on the pin} = \frac{T_p}{L_p \cdot d_p}$$

$T_p$  = effective traction force on the chain [kg]  
 $L_p$  = bushing length [mm]  
 $d_p$  = bushing length [mm]

Contact materials		Spec. press. max [kg/mm <sup>2</sup> ]
Bushing	Pin	
Casehardened steel	Casehardened steel	2,50
Casehardened steel	Hardened and tempered steel	2,10
Cast iron	Casehardened steel	1,75
Stainless steel	Stainless steel	1,20
Bronze	Casehardened steel	1,00

$$\text{Specific pressure on the roller} = \frac{P_r}{L \cdot D_r}$$

$P_r$  = load on each roller [kg]  
 $L$  = roller hole length [mm]  
 $D_r$  = roller hole diameter [mm]

Contact materials		Spec. press. max [kg/mm <sup>2</sup> ]
Roller	Bushing	
Casehardened steel	Casehardened steel	1,00
Hardened and tempered steel	Casehardened steel	1,00
Cast iron	Casehardened steel	0,70
Stainless steel	Stainless steel	0,40
Bronze	Casehardened steel	0,60
Polyethylene	Casehardened steel	0,10
Cast iron	Bronze	0,28

#### 6 – Requested shaft power

$$W = \frac{T D_p \omega}{2} \text{ [Watt]}$$

$T$  = total traction force of all chains [N]

$$D_p = \text{driving sprocket pitch diameter} = \frac{\text{Chain Pitch}}{\sin\left(\frac{180^\circ}{Z}\right)} \text{ [m]}$$

$Z$  = No. of teeth of driving sprocket  
 $\omega$  = No. of teeth of driving sprocket =  $n \cdot 0,1047$  [rpm]

The theoretical power value should be corrected according to the mechanical performance of the rotating components (motors, reduction gears, transmission chains, etc.)

## Non-standard metric pitch chains with solid pins

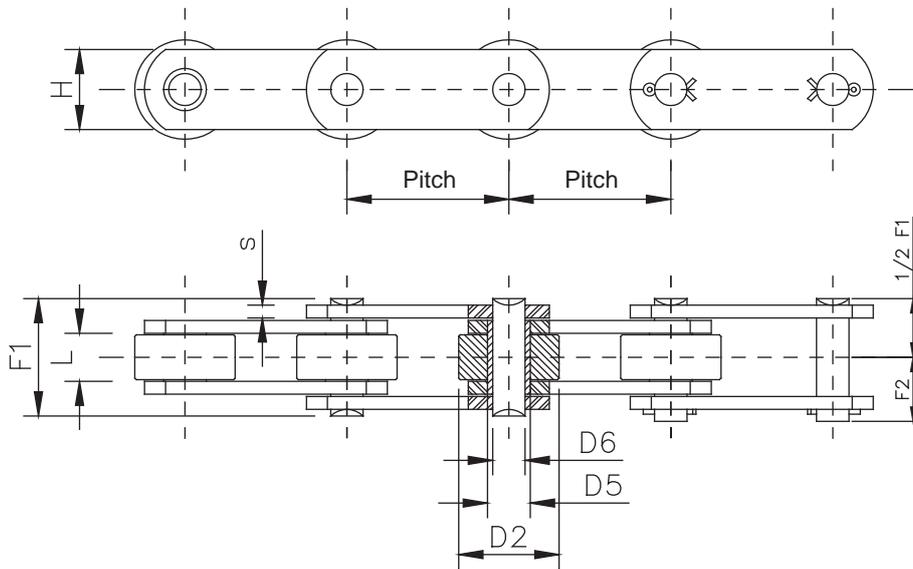

Following types are available:

- stainless steel attachments (SS code)
- nylon rollers
- Delrin rollers
- pre-loaded
- pre-selected

Available surface treatments:

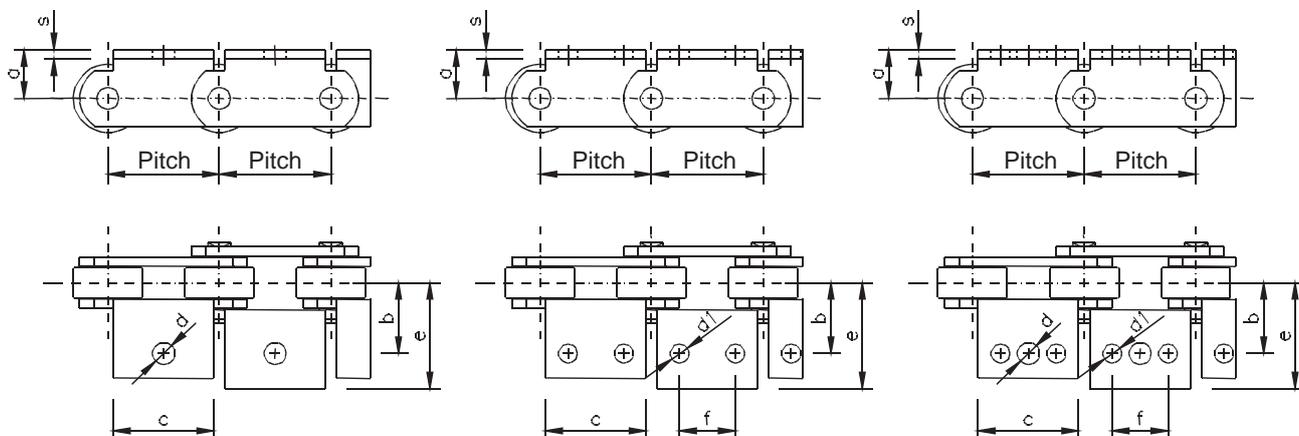

- Zinc plating
- Nickel plating

Sprockets on request.

## Non-standard metric pitch chains with hollow pins

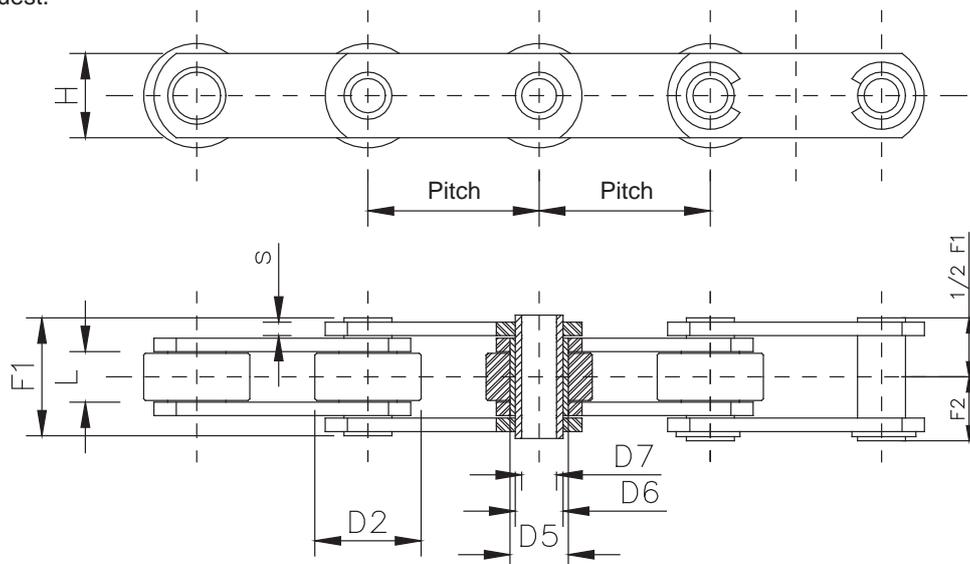

Following types are available:

- stainless steel attachments (SS code)
- nylon rollers
- Delrin rollers
- chains with bushing without roller
- plate wheels on request

Available surface treatments:

- Zinc plating
- Nickel plating

Plate wheels on request.

## Conveyor chains BS 4116 in inch pitch with eccentric rollers

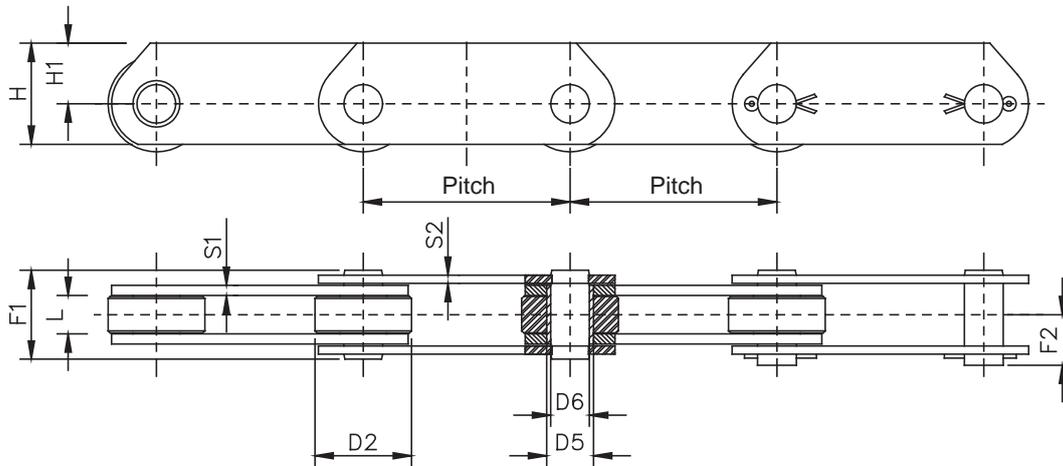

Following types are available:

- stainless steel attachments (SS code)
- nylon rollers
- Delrin rollers
- pre-loaded
- pre-selected

Available surface treatments:

- Zinc plating
- Nickel plating

Sprockets upon request.

# Conveyor chains British Standard ISO 1977 - DIN 8167 with hollow

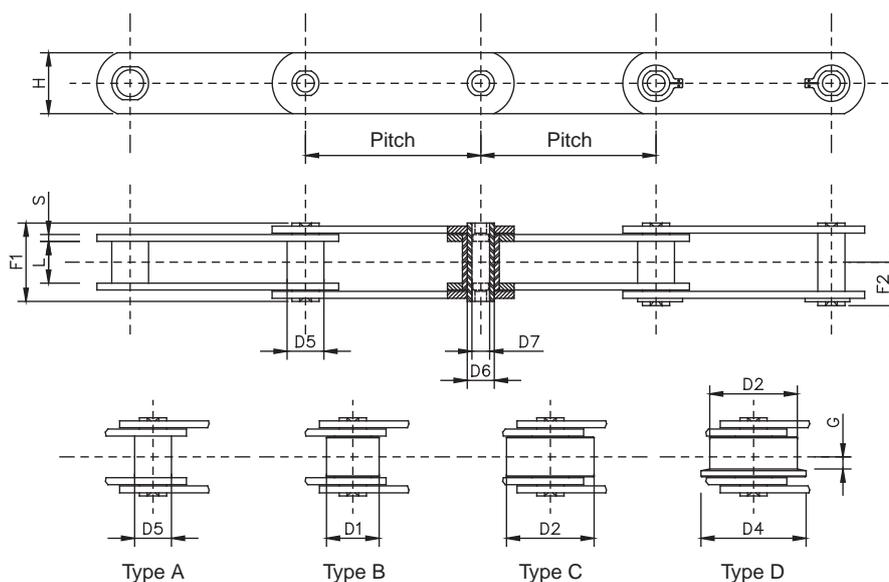

Following types are available:

- stainless steel attachments (SS code)
- nylon rollers
- Delrin rollers
- pre-loaded
- pre-selected

Available surface treatments:

- Zinc plating
- Nickel plating

Sprockets upon request.

## Malleable cast iron chains for case conveyors

This type of chain is used in medium corrosive environments to slide concentrated loads, mainly in the bottling industry to transport boxes or cases..

It is generally provided with profile rail guides and it can be used on curved conveyors.

It is made of cast iron with non-treated steel pins and it has following characteristics:

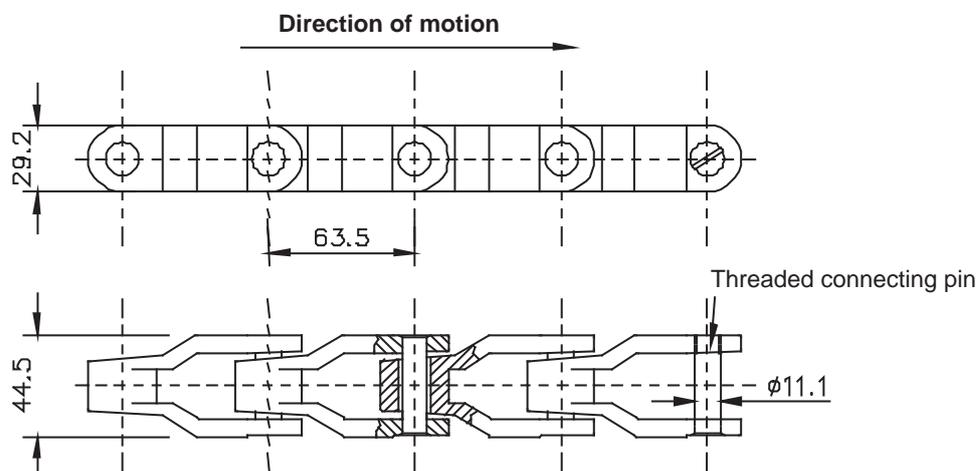

- riveted pin inside the plates
- large sliding surface
- curve radius minimum: 500 mm

Available models:

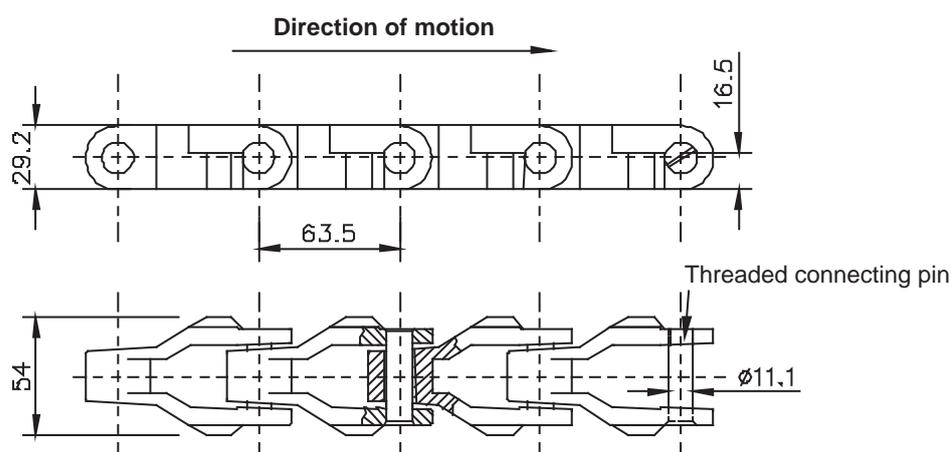

- draft and driving plate wheels of cast iron or acetal resin
- links of acetal resin or polypropylene with very low coefficient of friction

### CC600

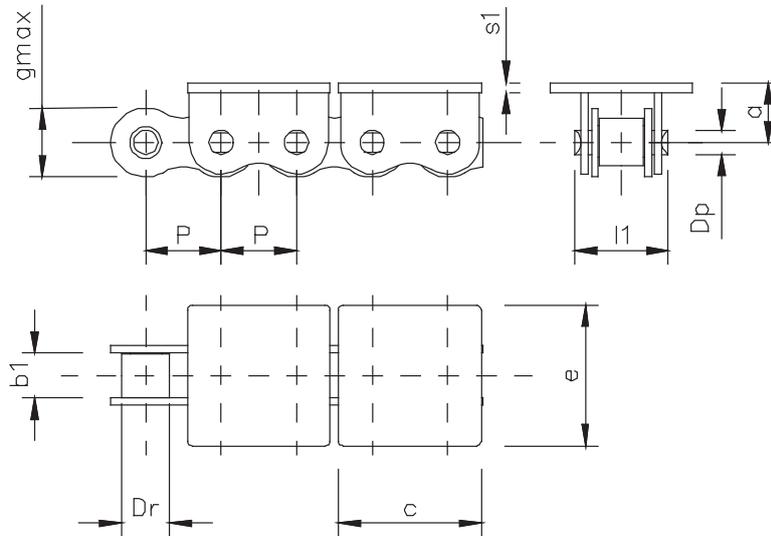

### CC600D

Chain type	Pitch [mm] p	Ultimate strength [N]	Operating load [N]	Curve radius [mm]	Chain weight [kg/m]
CC600	63,5	71.200	4.700	500	4,8
CC600D	63,5	71.200	4.700	500	5,5

## Conveyor chains for bricks and tiles

Sprockets can also be delivered upon request.

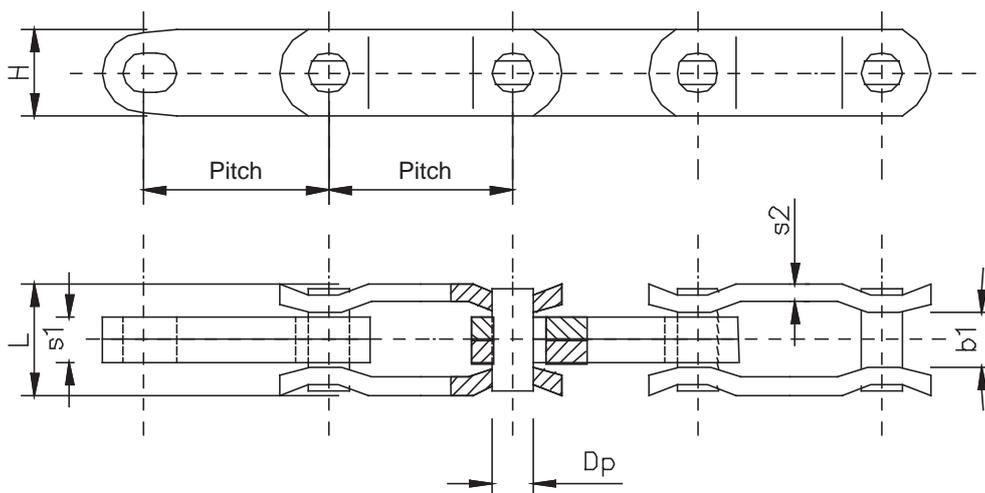

Chain N°	Pitch [mm] p	Inner width b1	Roller diameter Dr	Pin diameter Dp	gmax	Pin length l1	Cap height a	Cap surface c x e	Cap thickness s1	Ultimate strength min. [N]

# Pressed steel chains for overhead conveyors

## Removable links links

This type of chains consists of forged and treated steel elements and, in comparison to their weight, they have a very high ultimate strength.

The design allows simple manual assembly and disassembly.

They are used in overhead conveyors because these joints allow application on different levels. They can be used in long distance conveyors, ground conveyors, heavy industry conveyors (foundries, steelmills, mines).

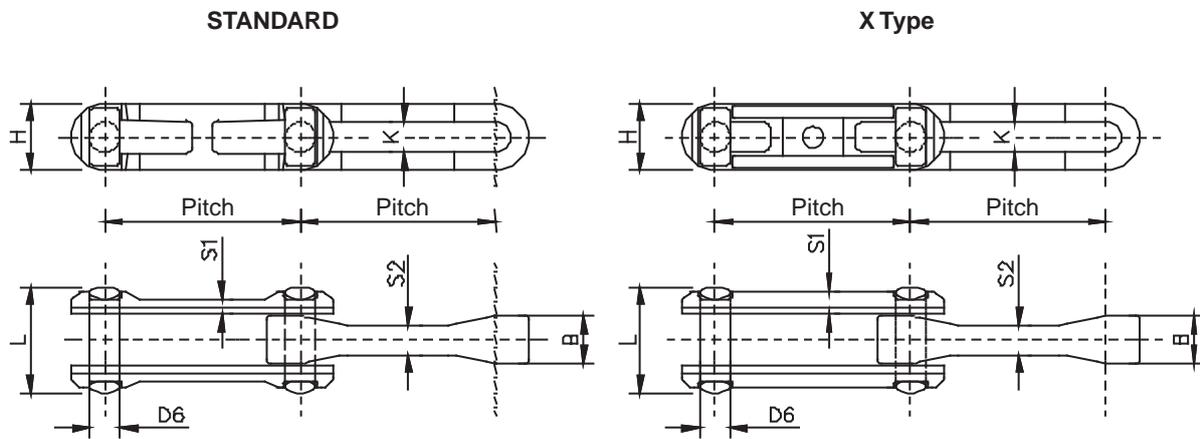

Standard chains are used in the vast majority of cases.

The X-type chains, on the contrary, are used for overhead conveyors combined with test and repair trolleys.

The symmetrical pins can be rotated of 180°, when they are worn out, to extend chain life.

All chain elements are made of hardened and tempered carbon steel or hardened and tempered alloy steel to obtain the maximum ultimate strength and higher wear resistance.

Different attachments are available, which allow the application on overhead conveyors with trolleys.

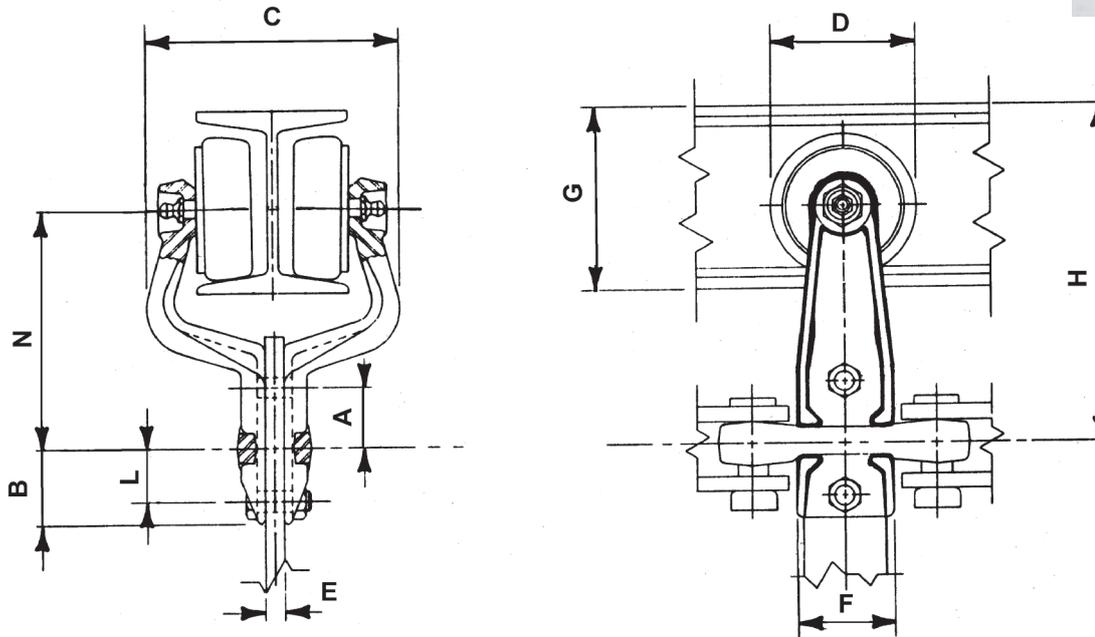

Chain N°	Pitch [mm] p	Pin diameter D6	Inner plate thickness B	Pin length L	Plate height H	Outer plate thickness S1	Inner plate thickness S2	Inner plate width K	Chain weight [kg/m]	Ultimate strength [N]
